

CHROMATOGRAPHY SYSTEM

Technological advantages

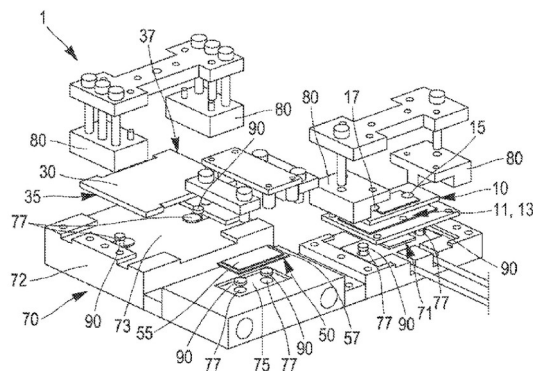

- Increased Mechanical Robustness: The unibody design provides resistance to vibrations and shocks.
- Advanced Miniaturization : use of MEMS reduces the mass, volume, and energy consumption.
- Optimized Fluidic Circulation.
- Integrated Thermal Management: precise temperature control for better pre-concentration and elution.
- Easier Maintenance.

Invention synthesis

The invention presents a miniaturized chromatography system designed for chemical analysis, well suited for demanding environments. This system integrates MEMS components for injection, separation via a chromatographic column, and detection of chemical compounds. A unibody metallic fluidic interface plate, serves as a robust structural support and ensures fluidic connections between the different elements. A mixture (typically gaseous) is injected into a cavity where a solid support retains compounds of interest, often by adsorption. After pre-concentration and heating, these compounds are transferred to a separation column, which separates them before a detector identifies them. This addresses the critical need for chemical analysis instruments that are compact, energy-efficient, and extremely resistant to severe mechanical and thermal conditions, all while ensuring reliable analyses.

Potential applications

- Space Exploration: Analysis of planetary atmospheres, detection of biomarkers on other celestial bodies.
- Environmental Monitoring: Detection of gaseous pollutants or contaminants.
- Security and Defense: Rapid identification of hazardous substances (toxic gases, explosives).
- Medical Applications: Portable diagnostics requiring the analysis of gases or complex mixtures.
- Industrial Process Control.

Schematic view of the chromatography system

- (1) chromatography device
- (10) injection device
- (30) separation column using chromatography
- (50) sensor
- (70) unibody fluidic interface plate
- (71) cavity for the injector
- (72) main metallic interface plate
- (73) cavity for the column for receiving (30)
- (75) cavity for the sensor for receiving (50)

Commercial benefits

- Access to New Markets: Opens opportunities in aerospace, defense, and environmental sectors where robustness and miniaturization requirements are high.
- Reduced Mission Costs: reduced mass and volume.
- Improved Reliability: robust design reduces maintenance and replacement needs.
- Rapid and versatile system : increased market potential.
